EXP.NO-5a	Patient Appointment Reports Suite — Reports, Dashboards and UI Builder

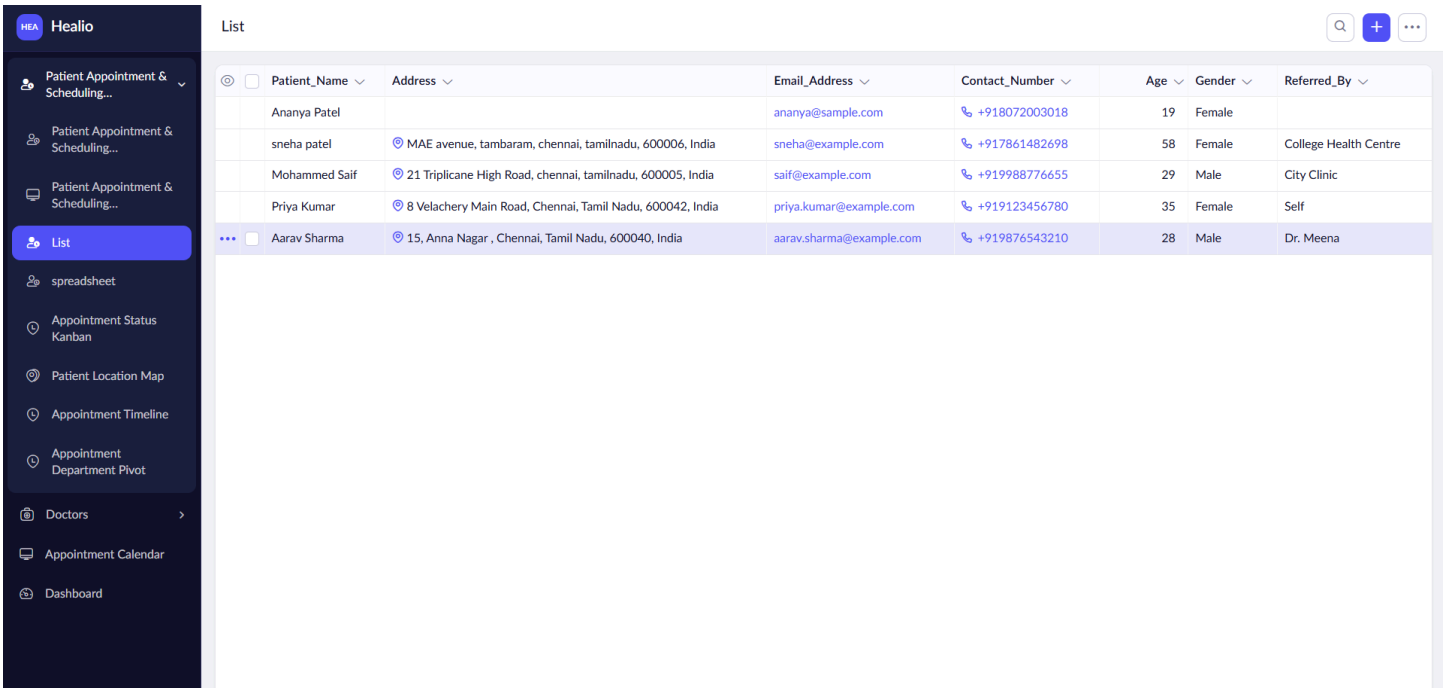

AIM:

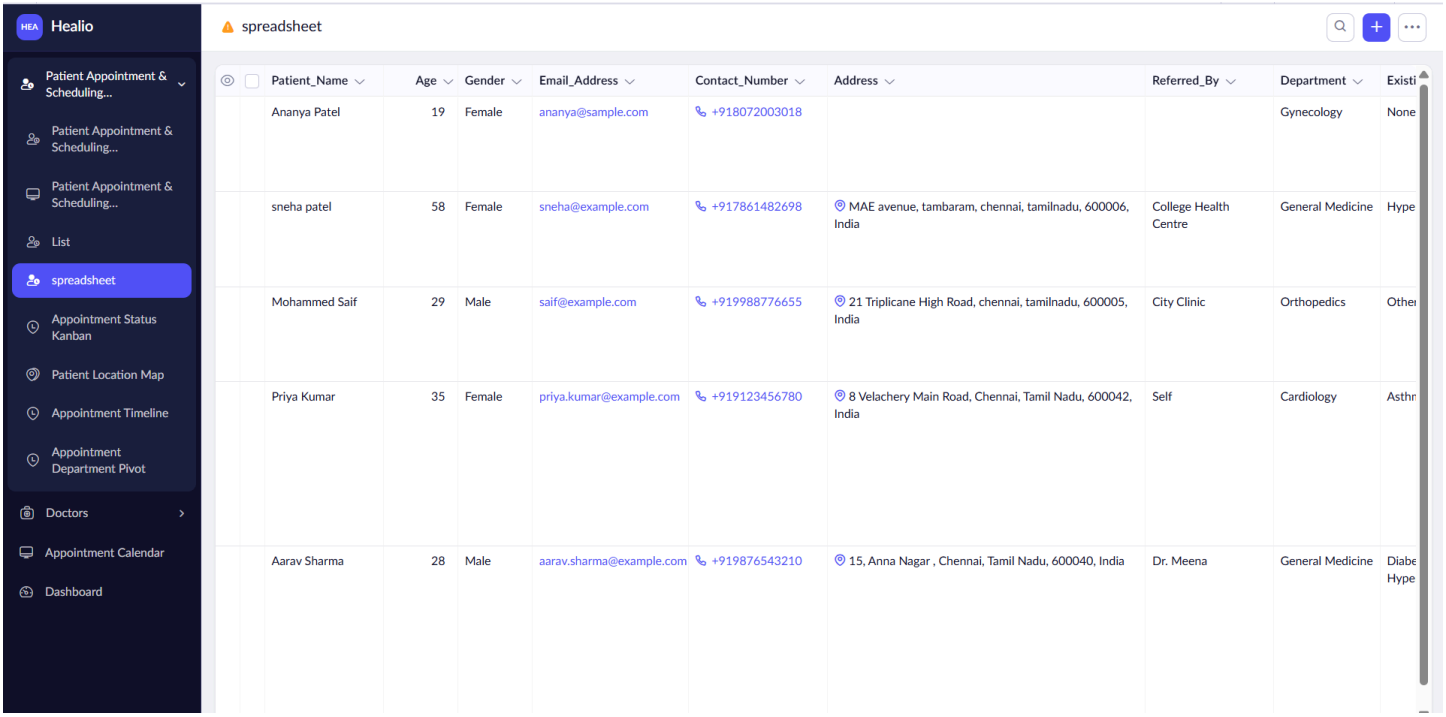

To design and build a set of Zoho Creator report types for a Patient Appointment & Scheduling Management application, enabling clinical personnel and administration to browse appointments, track workflow status, analyze department workload, and review record metrics.

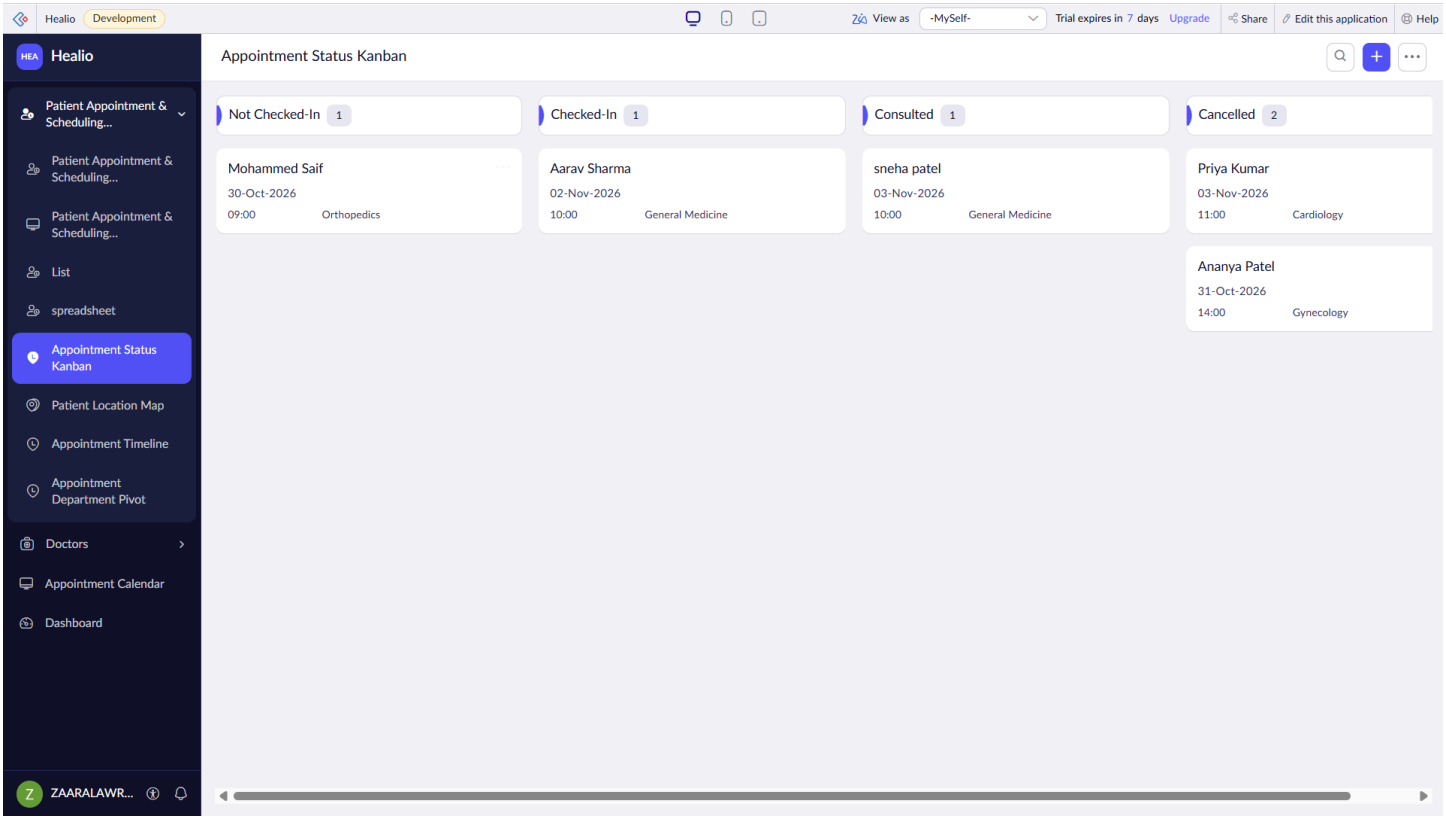

PROCEDURE:

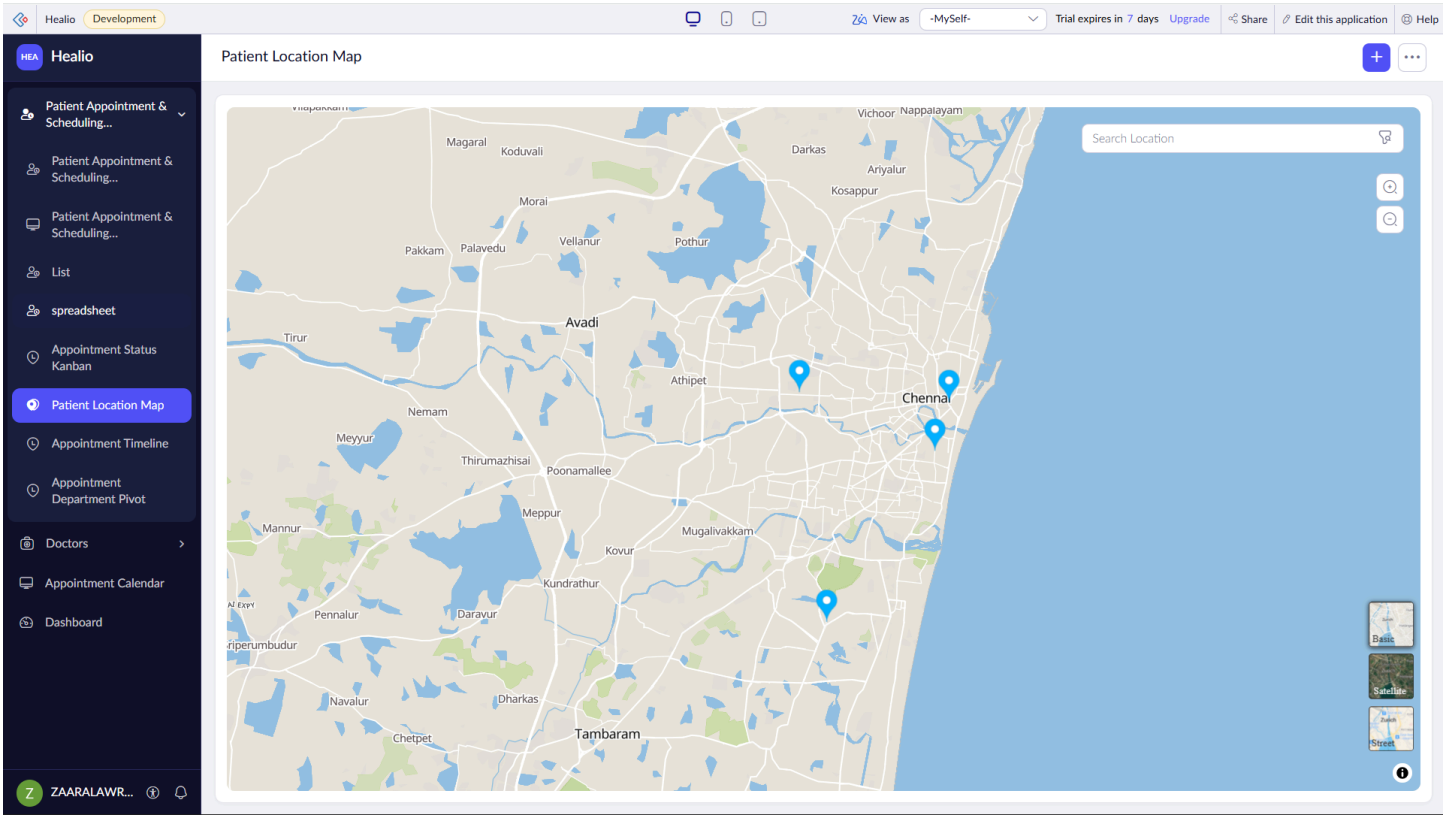

1. **All_Appointments_List (List View):** Displays appointment records in a tabular format containing patient demographics, relevant department assignments, and appointment dates/statuses within the specified date range.
2. **Appointments_Spreadsheet (Spreadsheet View):** Provides a spreadsheet-style interface featuring inline dropdown controls to update workflow status fields (such as check-in stage, consultation progress, and payment status).
3. **Appointment_Status_Kanban (Kanban View):** Displays tracking cards grouped by lifecycle status stages. Items can be monitored across various operational states from initial request to completion or cancellation.
4. **Appointment_Schedule_Calendar (Calendar View):** Renders scheduled appointments across standard chronological layouts (Month, Week, and Day views) according to preferred scheduling dates.
5. **Patient_Residential_Map (Map View):** Plots geographic coordinates using location markers centered around the designated target region to visualize patient distribution.
6. **Appointment_Activity_Timeline (Timeline View):** Provides a sequential day-by-day and week-by-week timeline view designed to track event progression and chronological operational activity.
7. **Department_By_Gender_Pivot (Pivot Table):** Aggregates and cross-references multi-dimensional metrics (such as demographic totals and record volumes) grouped by operational departments.

RESULT:

A comprehensive suite of nine distinct report views has been established for the Patient Appointment & Scheduling Management application. The structured analytical tools—comprising tabular lists, pivot matrices, and graphical distribution charts—are designed to synthesize multi-departmental record allocations and balance operational workloads across clinical personnel.
