EXP.NO-7	API Integration Using Zoho Creator Custom API

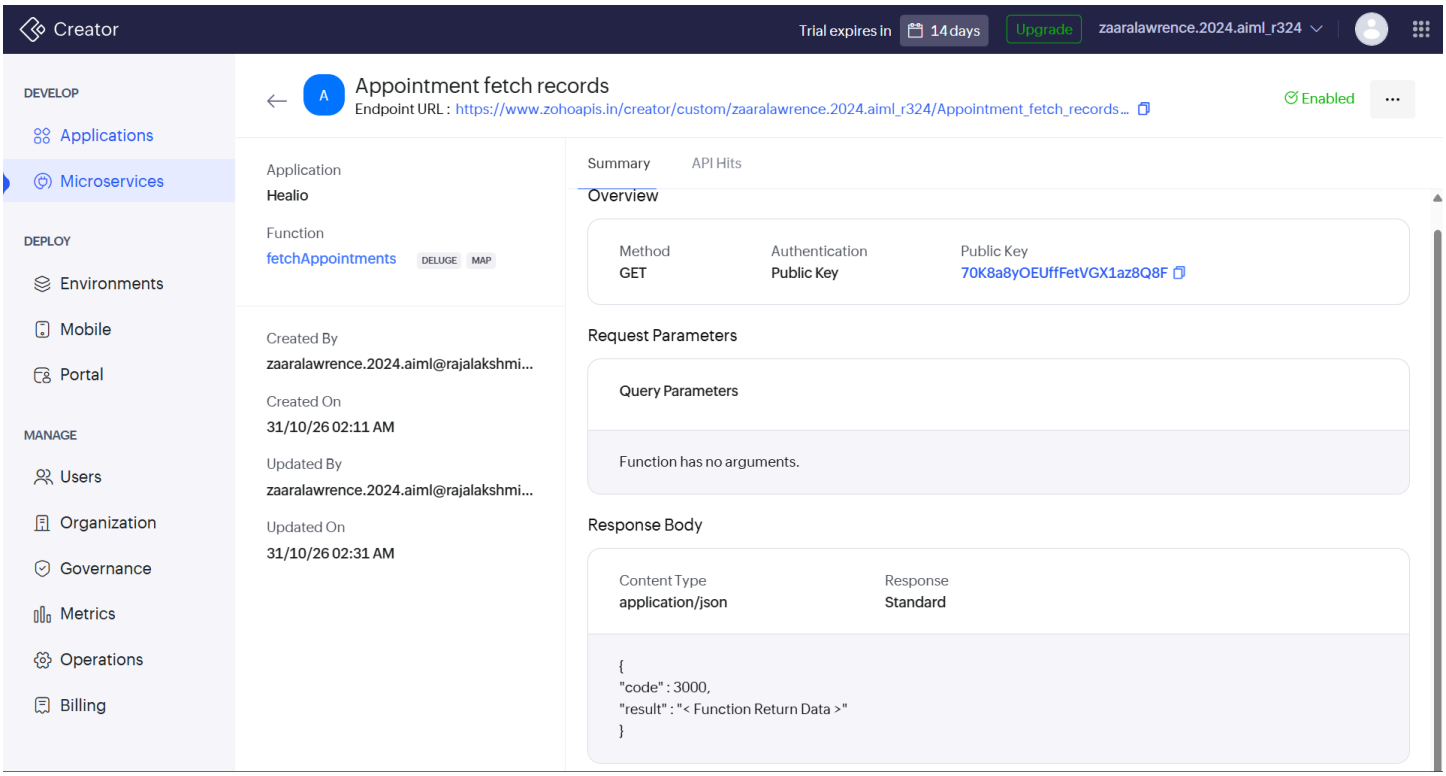

AIM:

To create and configure a custom API in Zoho Creator for the Patient Appointment System and view the API endpoint details for fetching appointment-related data.

PROCEDURE:

1. Open the Zoho Creator application and go to Microservices under the Develop section.
2. Choose the option to create a Custom API.
3. In Basic Details, enter a descriptive display name and link name for the API, such as Appointment fetch records and Appointment_fetch_records.
4. Configure the request method as GET for fetching data.
5. Create a Deluge function named fetchAppointments and set its return type to Map.
6. Associate the function with the Custom API in the Actions step, then complete and save the API configuration.
7. On the API summary page, check the endpoint URL, enabled status, request method, authentication type,request parameters, and response format.

OUTPUT:

RESULT:

A custom API named “Appointment fetch records” was created in Zoho Creator and its summary details were verified. The endpoint is enabled and configured for GET requests with JSON response format. This confirms that the custom API configuration is available for further testing with an API client.
